

Fly Cheat Codes System

How does it work?

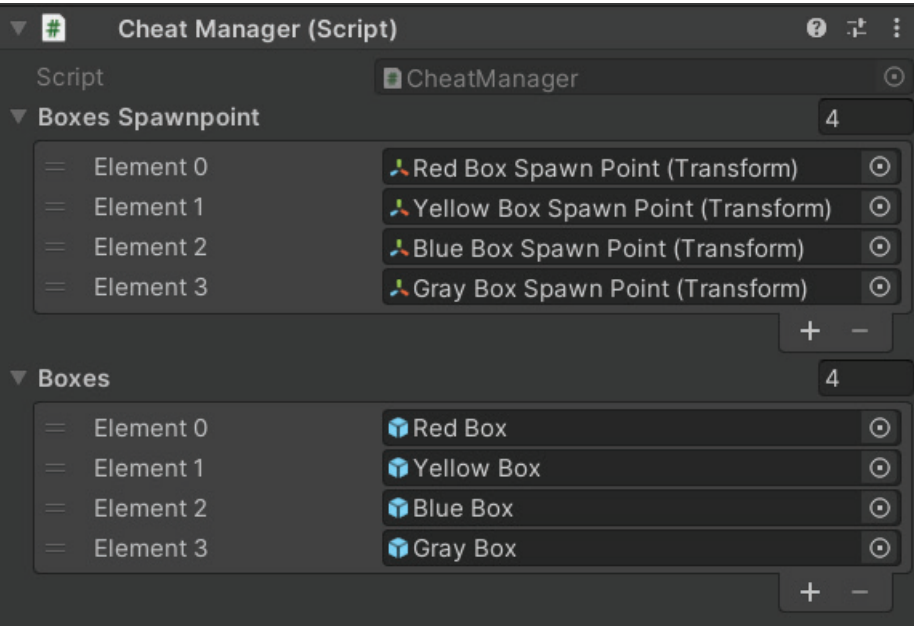

The system checks the combinations entered on the keyboard if a match is found with the code you created. The function placed by you will be run. You can use any combination of letters or numbers to create cheat codes.

Cheat Notification

It is a prefabricated built from an image and a text, with a simple animation, was created to inform the player, the developer, when a cheat code was activated. We place the notification in canvas, place the false status Set Active false (disable it) and drag it into our Cheat Code script. When the notification appears, it is driven with an information sound !

If you do not want to use the notification, simply do not add it to the script box, no error will occur !

Cheat Manager
When a combination of codes is found, the cheat function assigned to the code will be executed. So, in my case, I created a Chat Manager. When a cheat code is run, the cube assigned to the function will appear.

You can use another script or another combination, this was an example.

```

Unity Script (1 asset reference) | 0 references
public class CheatManager : MonoBehaviour
{
    public Transform[] BoxesSpawnpoint;
    public GameObject[] Boxes;

    0 references
    public void Spawn_Red_Box() //What we put in this function will run when the function-related combination is found.
    {
        Debug.Log("The Red Box is spawned"); //Shows in the console which function is running (For each function it can be individual).
        Instantiate(Boxes[0], BoxesSpawnpoint[0].transform.position, Quaternion.identity); //The Red box is generated
    }

    0 references
    public void Spawn_Yellow_Box() //What we put in this function will run when the function-related combination is found.
    {
        Debug.Log("The Yellow Box is spawned"); //Shows in the console which function is running (For each function it can be individual).
        Instantiate(Boxes[1], BoxesSpawnpoint[1].transform.position, Quaternion.identity); //The Yellow box is generated
    }

    0 references
    public void Spawn_Blue_Box() //What we put in this function will run when the function-related combination is found.
    {
        Debug.Log("The Blue Box is spawned"); //Shows in the console which function is running (For each function it can be individual).
        Instantiate(Boxes[2], BoxesSpawnpoint[2].transform.position, Quaternion.identity); //The Blu box is generated
    }

    0 references
    public void Spawn_Gray_Box() //What we put in this function will run when the function-related combination is found.
    {
        Debug.Log("The Gray Box is spawned"); //Shows in the console which function is running (For each function it can be individual).
        Instantiate(Boxes[3], BoxesSpawnpoint[3].transform.position, Quaternion.identity); //The Gray box is generated
    }

    //public void Spawn_Your_Function() //What we put in this function will run when the function-related combination is found.
    //{
    //    Debug.Log("The Your_Function is spawned");
    //}
}

```

Ways of use ?

- 1) You can spawn any object you need to test the game or make the game easier.
- 2) You give players the opportunity to experiment and have fun.
- 3) The most important thing is to remember childhood and write the codes on the sheet
